Sterisart® BD Media and Fluids
One-Stop Shopping for Sterility Testing
Sterisart® – Increasing Safety and Reliability

Pharmaceuticals, biologicals, medical devices and any material claiming to be sterile must be tested for sterility according to the procedures described in the International Pharmacopoeia. Manufacturers of sterile products are required to supply proof of the sterility of the final product batch.

The preferred method for sterility testing is the membrane filtration method using the closed disposable system Sterisart® NF. Virtually all pharmaceutical containers and product types can be tested thanks to the wide variety of Sterisart® NF units featuring different adapter types, which Sartorius Stedim Biotech offers.

Validation Service by CONFIDENCE®

Validation of the sterility test is essential for a quality program and to meet regulatory requirements.

CONFIDENCE® provides the closest interpretation of current regulatory requirements and industry standards. We are working with you to define relevant test conditions for your sample preparation based on your actual product formulation.

Validation of the sterility testing procedure is conducted in certified and FDA registered laboratories. cGMP recommendations are applied for the testing procedures.

Detailed protocols and reports are provided, including rationale, test results and method transfer assessment. These are in line with health authority requirements. Full traceability is available according to cGMP recommendations and internal quality systems.
Sterisart® BD Media and Fluids

In order to complete the product range of the disposable, ready-to-use, closed sterility testing system, Sartorius Stedim Biotech now offers prepared bottled Nutrient Media and Rinsing Fluids according to International Pharmacopoeia. As manufacturer, we chose BD as one of the well respected and best known media for producing quality. Sterisart® BD Media and Fluids are available in a variety of formulations, bottles and closure types, as well as filling volumes. Only the highest quality BBL and Difco brand dehydrated culture media are used for preparation.

Certified Quality

As all Sterisart® products, Sterisart® BD Media and Fluids are also manufactured in Germany. Every aspect of the production process – from raw materials to media manufacture, from R & D to QA/QC, from start to finish – is under manufacturer's supervision and control.

Sterisart® products are ideal for use in isolators

The pump is installed countersunk in the work area and the packaging of the consumables facilitates the transfer from a non-sterile into the sterile area of the isolator.

Sterisart® Universal pump, upgraded version 16420
Sterisart® NF gamma for closed containers, dual-needle metal spike, sterile vented, double-packaged, pack size 10 16466--------GBD
Sterisart® BD Medium, Type FTM (Fluid Thioglycollate Medium), acc. to EP|USP, 100 ml, pack size 44 BD-257097
Nutrient Media Types

FTM – Fluid Thioglycollate Medium according to USP | EP:
Liquid nutrient medium for the sterility testing of biologics and for the enrichment and cultivation of anaerobes, aerobes, and microaerophiles acc. to USP and EP. In order to avoid secondary contamination, the Sterisart® BD Media Type FMT is not under vacuum, but the headspace of the FTM is gassed with a stream of nitrogen to maintain anaerobiosis.

Sterisart® BD Media Type FTM contains a special quality of agar, resulting in a high clarity of the prepared medium.

Color code: red

TSB – Tryptic Soy Broth according to USP | EP:
A general purpose liquid nutrient medium used in sterility testing for the detection, isolation, and cultivation of fastidious and non fastidious microorganisms acc. to USP and EP.

Sterisart® BD Media Type TSB is a nutritious medium that will support the growth of a wide variety of microorganisms, including common aerobic and facultatively anaerobic bacteria and fungi.

Color code: blue

Rinsing and Diluting Fluids

Fluid A and Fluid D according to USP
Three different steps are required by the compendia depending on the condition of the sample:

– Rinsing: Sterile devices or materials are rinsed in order to release adhered microorganisms. After filtration of the sample, the Pharmacopoeia also require rinsing steps to be performed on the entire Sterisart® NF unit.

– Diluting: Small volumes or viscous liquids are diluted for better filterability

– Dissolving: Solid samples or ointments are dissolved for better filterability

Fluid A (peptone water)
Fluid A is used for diluting, dissolving and rinsing of all types of samples.

Fluid D (Fluid A with 0.1% polysorbate 80)
Fluid D is peptone water with 0.1% polysorbate 80 (TWEEN® 80). It is used for those samples types which contain lecithin or oil.

Another application is to rinse articles and devices with bacteriostatic or fungistatic activity. Polysorbate 80 may act as an inactivator of microbicides present in or on a testing sample.

The use of Sterisart® BD Fluid A and Fluid D does not affect the viability of microorganisms.

Both Sterisart® BD Fluid Types, Fluid A and Fluid D, are according to the specifications of the United States Pharmacopoeia (USP).
Sterisart® BD Media and Fluids complete our product line for sterility testing providing one source for all your needs.

Sterisart® BD Media and Fluids are sterilized by autoclaving in their final primary bottles. They are used on clean benches or in clean rooms. Special packaging types are ideal for transferring media from non-sterile areas into sterile areas such as isolators.

Multi-packaged, ETO-sterile

The autoclaved filled bottles are packaged into a polypropylene box which is then sealed into a Stericlin® bag and sterilized by ethylene oxide (ETO). This treatment provides a sterile outer surface of the bottles and the packaging. The multiple-packaging allows the transfer of the bottles into clean rooms from a non-sterile into a sterile area.

- Sterile outer surface of the bottles eliminating the need for spraying down bottles before transferring them into clean rooms or isolators.
- Polypropylene boxes reduce shedding of particles to a minimum.
- Compact packaging saves working space.
- Optimal for small clean room areas such as isolators due to clever waste management.

Crimp cap stopper
The stopper is fixed by a crimp cap

Type 3

Screw cap with septum
The cap can be easily pierced or untwisted

Type 4
- Transparent labels allow a clear view of media and cultures.
- Labels resist alcohol and chlorine treatment.
- Color-coded caps and labeling for the nutrient media allow easy product identification.
- Specially developed clear FTM for much easier growth detection.
- Growth performance test conforms to EP and USP requirements.
- Extensive Certificates of Analysis showing microbial recovery of all microorganisms listed in EP and USP.

Individually double-packaged, sterile

The filled bottles are packaged into two Stericlin® bags prior to autoclaving. This unique manufacturing process results in a bottle exterior that is free from microbial contaminants.

- Double-packaging ensures that the area under the cap remains sterile, therefore reducing the risk of false positive results.
- Sterisart® BD Media and Fluids are validated at a sterility assurance level (SAL) of $10^{-6}$.
- Sterisart® BD Media and Fluids comply with the requirements set forth in the International Pharmacopoeia such as EP and USP.
- Optimal for all clean room areas including isolators due to easy and reliable transfer into the sterile area.
