

CIMmultus® Monolithic Columns

Pre-Packed Preparative
Columns for Purification
of Large Biomolecules

Portfolio Overview

CIMmultus® is a unique line of ready-to-use monolithic columns distinguished by wide flow-through channels and designed for fast and gentle purification of large biomolecules. CIMmultus® columns can be used as single-use disposable or multiuse columns. The polymethacrylate monolith is housed in reinforced epoxy thermoset materials coated in USP Class VI Parylene C. This gives CIMmultus® columns the structural strength of stainless steel and ensures extractables and leachables-free processing. CIMmultus® columns are cGMP compliant. Scalable from 1 mL to 40 L, CIMmultus® columns are available with 1.3 µm, 2 µm, and 6 µm channels, and a broad range of chemistries.

Key Benefits

Relevant Applications

CIMmultus® columns are used for the preparative purification of large biomolecules:

Application Examples

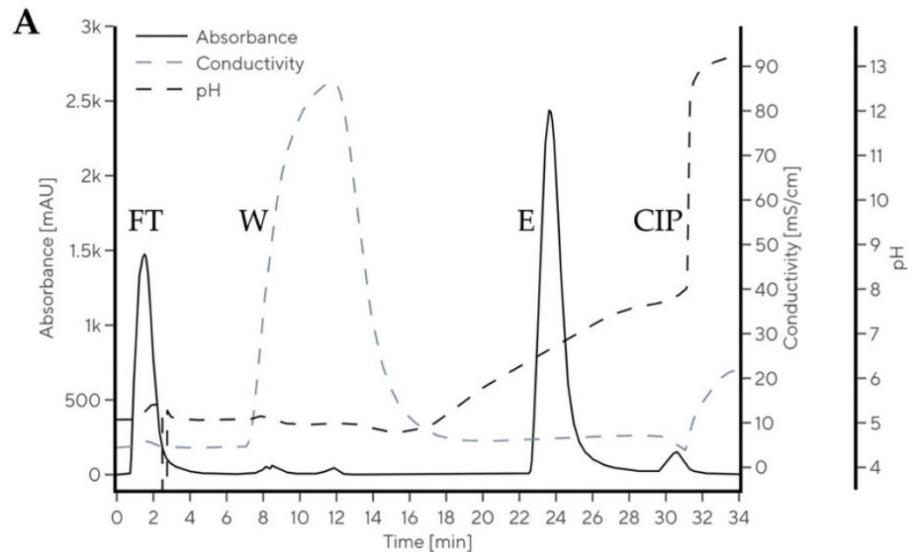

Final polishing and removal of empty AAV capsids is conducted on a CIMmultus® QA anion exchange monolith in a salt gradient at alkaline pH.

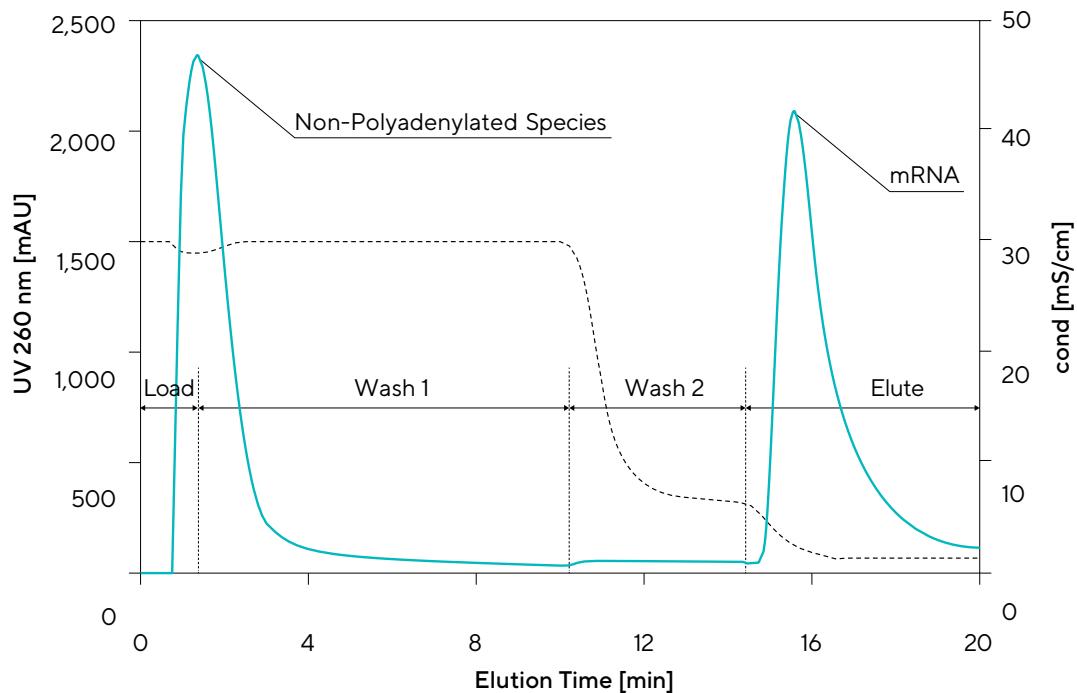

Plasmid DNA is captured on CIMmultus® DEAE, a weak anion exchange column, where remaining RNA and proteins are removed. Sample binding requires low conductivity, achieved by dilution. Elution with increasing NaCl steps elutes RNA first, followed by elution of plasmid DNA.

mRNA non-Affinity Purification

CIMmultus® Swiper purifies polyadenylated and non-polyadenylated single-stranded RNA (ssRNA) and is particularly suitable for self-amplifying RNA (saRNA). It removes nucleoside triphosphates (NTPs), enzymes, DNA template at room temperature and neutral pH.

mRNA Affinity Capture

CIMmultus® Oligo dT provides a single-step affinity capture of mRNA. Binding occurs through hydrogen bonding, with the oligo dT forming a stable hybrid association with the terminal poly(A) sequence of the target. Non-RNA contaminants flow through the column during sample loading.

Relevant Process Steps

CIMmultus monoliths are employed for large biomolecule purification using multiple chemistries and across scales, from process development to production of materials for

- pre-clinical | tox studies
- clinical phases
- commercial production

CIMmultus columns are used for both capture and polishing processing steps, primarily in bind-and elute mode.
